AGRIFUTUR SENSOR ECOSYSTEM

Going beyond irrigation

AgriFutur

Wireless Sensors Made Simple
for agroecology & sustainable agriculture

Powered by technologies developed in Intel-IrriS

- Use the same approach of cost-efficiency and out-of-the-box deployment, expanding the sensor ecosystem
- Complementarity & Adaptability: high-end, low-end, innovative, ...
- Target Agroecology, Nature-Based Solutions & Sustainable Agriculture
- Better Qualify & Quantify the impact of these new practices
- More data = more correlation in agroecological system

List of components

For SOLAR

For 2xAA
alkaline
batteries

For SOLAR with
NiMH battery

SMA
male

Reduce power consumption

Do not forget to remove the power LED by just clipping it off with some wire cutters

Do not forget to remove the voltage regulator with a small plier

Only inject up to 3.6V through the VCC pin

Power consumption in deep sleep

Measured below 5 μ A in deep sleep, between 2 active periods with transmissions

Expected autonomy with 1 transmission / hour is over 2 years with 2 AA batteries

The PCB v4.1 – raw version

- You can order the raw version of IRD PCB, which means only the PCB, without any electronic components soldered by the manufacturer
- It is the so-called DIY approach
- The raw version is not intended to have solar charging capabilities

Electronic parts

Arduino ProMini 3.3V 8MHz

Tutorial video

- ⦿ This dedicated video from INTEL-IRRIS will show how to solder all the components: Video n°1: <https://youtu.be/3jdQ0Uo0phQ>
- ⦿ It features the "old" version of the INTEL-IRRIS PCB but you can easily adapt for the PCB v4.1

Updates on Video n°1

- Clip the SMA connector to the PCB to correctly align the connector before soldering one of the GND pad, then remove clip and finish soldering
- Or, gently press SMA connector pads so that insertion on PCB is harder and SMA connector will not move during soldering
- Make sure that the GND pads and the central pin are not touching each other, in doubt, do a continuity check

Soldering parts on PCB v4.1

- ⦿ Solder the various components on the top face

The raw version is not intended to have solar charging capabilities. For solar charging, the full version (see later) is the dedicated PCBA

✗ Not needed for the raw PCB which is not designed to have the solar circuit manually soldered

Wiring switch & bat on PCB v4.1

- Power wires (from 2xAA alkaline battery holder)

Image shown is the PCBA v4.1 from INTEL-IRRIS

Switch middle wire

Switch left wire

This is normally the OFF position

OFF ON

Image shown is the PCBA v4.1 from INTEL-IRRIS

H1 & H2 header on PCB v4.1

- ⦿ The raw version is not intended to have the solar circuit soldered manually on the back side
 - ⦿ 2 alkaline AA batteries will be used similar to the simple PCB v2
 - ⦿ It is necessary to short the 2 external pins of H2 connector and the 2 pins of H1 connector

Connect
for alkaline
batteries

Image shown is the PCBA v4.1 from INTEL-IRRIS

Explanation of previous slide

- As can be seen, the raw PCB does not have Q3 to connect Vcc to VccM, the power line for all physical sensors controlled by A1 pin
- Therefore H1 needs to be shorted to directly connect A1 to VccM

*Do not use solar without battery
Solar 6 V 100 mA (15 V maxi)

We actually directly connect bat+ to Vcc because 2xAA batteries gives about ~3.3V so no regulator is needed

Alternatives for batteries

- Simple 2xAA 1.5V batteries delivering $\sim 3.2V$ when new can be too low for some settings where the connected sensors needs a stable voltage close to 3.3V, especially when the highest quality for alkaline/lithium AA 1.5V batteries are not easily found
- There are other alternatives as illustrated below

Li-ion or LiPo = 3.7V

1xAA 14500 3.6V

1 x 18650 = 3.7V

3xAA $\sim 4.8V$

- The 3xAA is the simplest and the cheapest alternative

Using 3xAA alkaline batteries

- ⦿ The 3xAA battery holder is too big for the selected case. If we keep the same case, here is a possible solution
- ⦿ In addition to the already 2xAA battery holder, add a 1xAA battery holder
- ⦿ Connect 2xAA bat- (black) to BAT-
- ⦿ Connect 2xAA bat+ (red) to 1xAA bat- (black)
- ⦿ Connect 1xAA bat+ (red) to BAT+
- ⦿ Both battery holders can be put in the case, see next slide

Using 3xAA, keep Pro Mini regulator

- With 3xAA providing $\sim 4.8V$, we **MUST KEEP** the Arduino Pro Mini on-board voltage regulator!

Do not forget to remove the power LED by just clipping it off with some wire cutters

Do not forget to remove the voltage regulator with a small plier

Only inject up to 3.6V through the VCC pin

Connect for 3xAA alkaline batteries

Image shown is the PCBA v4.1 from INTEL-IRRIS

Both battery holders can be put in the case

Explanation of previous slide

- With 3xAA batteries providing 4.8V, we need a voltage regulator to get down to 3.3V. **As the raw PCB does not have a regulator (U1)** we will use the regulator of the Pro Mini that we keep for this 3xAA batteries version
- Therefore we connect bat+ to RAW of Pro Mini to use its regulator which will deliver 3.3V to Vcc – consumption will be about 45uA in deep sleep
- H1 still needs to be shorted to directly connect A1 to VccM

We actually directly connect bat+ to RAW of Pro Mini in order to get Vcc=3.3V with the on-board regulator

Image shown is the PCBA v4.1 from INTEL-IRRIS

Wiring with PCBA v4.1

- ⦿ The PCBA is already fully assembled, including the resistors for the temperature and watermark sensors (on the back side)

Image shown is the PCBA v4.1 from INTEL-IRRIS

The full version
does not need to
have header for H1

The solar circuit is on
the back side

Image shown is the PCBA v4.1 from INTEL-IRRIS

Wiring with PCBA v4.1

- Power wires (from NiMh batteries or AA alkaline batteries)

Image shown is the PCBA v4.1 from INTEL-IRRIS

Switch middle wire

Switch left wire

This is normally the OFF position

OFF ON

Image shown is the PCBA v4.1 from INTEL-IRRIS

Wiring with PCBA v4.1

- ⦿ The full version (PCBA) comes with the solar charging circuit
- ⦿ **BUT** you can still power it with 2 alkaline AA batteries without using a solar panel to avoid external fragile parts
- ⦿ You can select between **solar charging with NiMh batteries** or **no solar charging with 2 alkaline AA batteries**

Connect
for SOLAR
with NiMh

Connect
for alkaline
batteries

Image shown is the PCBA v4.1 from INTEL-IRRIS

Alternatives for no rechargeable batteries

- Simple 2xAA 1.5V batteries delivering $\sim 3.2V$ when new can be too low for some settings where the connected sensors needs a stable voltage close to 3.3V, especially when the highest quality for alkaline/lithium AA 1.5V batteries are not easily found
- There are other alternatives as illustrated below

Li-ion or LiPo = 3.7V

1xAA 14500 3.6V

1 x 18650 = 3.7V

3xAA $\sim 4.8V$

- The 3xAA is the simplest and the cheapest alternative

Using 3xAA alkaline batteries

- ⦿ The 3xAA battery holder is too big for the selected case. If we keep the same case, here is a possible solution
- ⦿ In addition to the already 2xAA battery holder, add a 1xAA battery holder
- ⦿ Connect 2xAA bat- (black) to BAT-
- ⦿ Connect 2xAA bat+ (red) to 1xAA bat- (black)
- ⦿ Connect 1xAA bat+ (red) to BAT+
- ⦿ Both battery holder can be put in the case, see next slide

Using 3xAA, use PCBA voltage regulator

- With 3xAA providing $\sim 4.8V$, we can use the PCBAv4.1 on-board voltage regulator that is more efficient than the one of the Pro Mini
- The regulator on the Pro Mini should then be removed with the PCBA version
- Consumption will be about 55uA in deep sleep

Image shown is the PCBA v4.1 from INTEL-IRRIS

Both battery holders can be put in the case

Explanation of previous slide

- With PCBAv4.1, all components are present: Q3 allows to inject V_{cc} into V_{ccM} when A1 is HIGH; regulator U1 can be used to get down from 4.8V to 3.3V

We first connect bat+ to LDO IN, then we connect LDO OUT (3.3V) to Vcc

PCBA: Installing solar panel (1)

- Mini solar panel
6 V 0.6 W 100 mA 60x90mm

The case cover has
a mark indicating the
center

Drill a hole with a
10mm to 12mm
drill bit for metal

Solder 2 wires on + and -

PCBA: Installing solar panel (2)

- Use silicon or glue to assemble the solar panel on the case cover
- Make sure there is no discontinuity of glue, also add glue around the centered hole surrounding the wires

Wiring with PCB1 v4.1

- ⦿ Solar panel wires

Image shown is the PCBA v4.1 from INTEL-IRRIS

Wiring with PCB1 v4.1

- Connect NiMh batterie packs with a 2-pin female connector
- You can screw in a 2-pin male 90° header

You can buy NiMh battery packs with a 2 pin connector that can be used for fast connection

IMPORTANT: Arduino ProMini

- For solar charging, using the PCBA v4.1, the Arduino ProMini **MUST** have pin A7 connected!

Image shown is the PCBA v4.1 from INTEL-IRRIS

- So, it is **MANDATORY** to solder a 3-pin header for GND, A6 & A7 on the Arduino ProMini board

Soil device with PCBA v4.1, final result

Image shown is the PCBA v4.1 from INTEL-IRRIS

Using 3xAAA batteries

- You can alternatively use 3xAAA NiMh rechargeable batteries with a battery holder
- This would allow you to slip the 3xAAA battery holder under the PCBA board

Image shown is the PCBA v4.1 from INTEL-IRRIS

Externally charging NiMH batteries (1)

- ◉ Normally, the solar panel should charge the NiMH batteries during the day, with sufficient power for regular operation of the device
- ◉ However, if the device has been stored for a long period in the dark, the battery charge level may have dropped too much
- ◉ In this case, it will need to be charged by an external source of power
- ◉ If you are using 3xAAA NiMh rechargeable batteries with a battery holder, it is straightforward to charge the individual AAA batteries with an NiMh battery charger
- ◉ If you are using a 3xAAA battery pack you can then directly use the PCBA to charge the pack as described in the next slide

Image shown is the PCBA v4.1 from INTEL-IRRIS

Externally charging NiMH batteries (2)

- With a solar panel and the 3xAAA NiMh battery pack connected to the PCBA, it is possible to directly charge the battery pack using the on-board regulator for slow charging mode
- First, the Arduino ProMini microcontroller must be OFF
- Then, disconnect the 2 wires of the solar panel
- And connect instead an external DC source at 5V

Make sure that switch is on OFF position

You can simply take power from a USB source – with a modified USB cable – here we show with a USB multimeter in-between

Or, you can use an adjustable DC-DC step-down buck converter

Image shown is the PCBA v5 from INTEL-IRRIS

PCB/PCBA v4.1 pin description

- The PCB has the following pre-defined wiring to Arduino ProMini pin

https://github.com/CongducPham/PEPR_AgriFutur/blob/main/PCBs/IRD_PCB_4_1/Schematic_IISS_4_1_2023-09-27.pdf

Wiring sensors with PCB/PCBA v4.1

- SEN0308 capacitive (or other capacitive)

**Just connect the sensor
in the dedicated header
– – are the 2 black wires
+ is red and H is yellow
H is the analog output and
is linked to A0**

Image shown is the PCBA v4.1 from INTEL-IRRIS

Wiring sensors on PCB/PCBA v4.1

- First DS18B20 temperature sensor

Solder a 4.7kOhms resistor (raw PCB only) then wire in the dedicated terminal block
T+ – : Yellow, Red, Black wires
T is linked to D6

Wiring sensors on PCB/PCBA v4.1

First Watermark

Solder a 10kOhms resistor (raw PCB only) then wire in the dedicated WM1 terminal block

Wiring sensors on PCB/PCBA v4.1

Second Watermark

No additional resistor needed
just wire in the dedicated
WM2 terminal block

Image shown is the PCBA v4.1 from INTEL-IRRIS

Wiring sensors on PCB/PCBA v4.1

- ⦿ SHT2x for ambient temp/hum

Image shown is the PCBA v4.1 from INTEL-IRRIS

Wiring sensors on PCB/PCBA v4.1

- ⦿ Sensirion SCD30/40 for CO₂

Image shown is the PCBA v4.1 from INTEL-IRRIS

Wiring sensors on PCB/PCBA v4.1

2nd & 3rd DS18B20 temperature sensor

Image shown is the PCBA v4.1 from INTEL-IRRIS

For 2nd DS18B20:
connect yellow to D7 and
connect a 4.7kOhms resistor
between yellow and + taken
on the CN1 connector. You
can use a Dupont wire or a
jumper.

For 3rd
DS18B20:
connect
yellow to D8
and the
4.7kOhms
resistor with
the red wire
of CN5

For 3rd DS18B20:
connect black & red
to – and + of CN5

For 2nd DS18B20:
connect black & red
with 1st DS18B20
black & red

Get an enclosure for outdoor usage

Here, it is an IP65 box which dimension is 115 x 65 x 40mm

<https://www.gotronic.fr/art-boitier-abs-etanche-g304m-17977.htm>

Drilling machine and drilling bits

At least a simple cordless drilling machine is necessary
If you have a (small) bench drilling machine it is of course better
Then you need an assortment of drilling bits for **metal**, not for wood nor concrete! Here, you will mainly need 7mm and 13mm bits
It is also interesting to have step drill bits

Drill a hole for the SMA connector

If 3xAAA battery holder is used, having 11mm is mandatory!

26mm for the right edge:

- measure from the flat side as the corner is round
11mm from the outside bottom

use a 7mm drill bit for metal, not for wood nor concrete!

Placing the PCB board

Image shown is the PCBA v4.1 from INTEL-IRRIS

With this particular enclosure case, it is better to have the hole about **1mm** next to the plastic reinforcement part

The board can be placed with the SMA connector going through the hole. The 2-AA battery holder is put next to the PCB

Drill a hole for the external switch

20mm for the right edge:

- measure from the flat side as the corner is round
9mm from the outside bottom

use a 7mm drill bit for metal

Drill a hole for the cable gland

For a PG7 cable gland, you may need 12mm or 13mm hole. If 13mm, a step drill bit can be used first to get 12mm.

41mm for the right edge:

- measure from the flat side as the corner is round
- 9mm from the outside bottom

use a 13mm or 12mm drill bit for metal. If 13mm, it is recommended to use a step drill bit to first get a 12mm hole before

Remove unwanted plastic part

It may be needed to remove the plastic reinforcement part for this particular enclosure: use a flat cutter for instance to remove and smooth the inside part (a small plier can be used first to remove most of the part)

But that may be not necessary if you can securely screw in the cable gland (right-most photo)

Going for larger production

If you need to prepare many enclosures, it may be faster to first make an assembly jig (here a piece of metal) for marking the holes

But be sure to precisely align the edge of the jig with the edge of the enclosure

Placing switch and cable gland

test that everything is OK

the switch has a water-proof rubber cap which should be carefully tighten

Connecting antenna

Be sure to connect the matching antenna
Here, SMA female with SMA male antenna
Need to screw the antenna in all the way

The antenna junction is **critical because this is where rain water can come in**

Waterproofing the antenna junction

Check the gap size

See example in the list of part

Even when the antenna is screwed in all the way, there might still be a gap

Even with no apparent gap, it is necessary to waterproof the junction

Take flat silicon seals for that purpose, but do not take it too thick or too large!

Too thick: the antenna will not be screwed in all the way!

Do not have or can not use flat seal ?

Maybe the gap is too big? Use
silicon joint sealant

First, screw in the antenna all the way

Put small amount of silicon around
the antenna junction (use a flat screw
driver or other flat tool)

Use a wet toothpick to finish and
clean the silicon all around the
antenna junction

check especially
the back side

Getting the software: Arduino IDE

Install latest version of Arduino IDE from
<https://www.arduino.cc/en/software>

Getting the AgriFutur code

On your computer, create a sketch folder

Then download the whole repository as ZIP file

Unzip the file and copy the content of `Arduino` folder into your sketch folder

With the `libraries` folder

The entire AgriFutur GitHub repository is hosted here
https://github.com/CongducPham/PEPR_AgriFutur

GitHub

Setting your Arduino IDE

Run Arduino IDE, open Preferences
Indicate your sketch folder in Sketchbook location

Configuration for PCB/PCBA v4.1

- ⦿ For raw version, uncomment `IRD_PCB` in `BoardSettings.h`
- ⦿ For PCBA version, also uncomment `IRD_PCBA`

```

////////////////////////////////////
// uncomment for IRD PCB board (both v4.1 and v5)
#define IRD_PCB
// also uncomment for IRD PCB board fully assembled by manufacturer
// with all components, including solar circuit (both v4.1 and v5)
#define IRD_PCBA
    
```

- ⦿ **ONLY for solar version**, uncomment `SOLAR_BAT`

```

////////////////////////////////////
// uncomment only if the IRD PCB or PCBA is running on solar panel
// MUST be commented if running on alkaline battery
// code for SOLAR_BAT has been written by Jean-François Printanier from IRD
#define SOLAR_BAT
// do not change if you are not knowing what you are doing
#define NIMH
    
```

Compiling the soil sensor code

Image shown is the Arduino IDE with INTEL-IRRIS code

Open Generic_Simple_Sensor_Node sketch – **default configuration builds a capacitive sensor device**

Select the ProMini board, 3.3V and 8MHz version

Then click on the "verify" button

Never transmit without antenna

- ⦿ NEVER, NEVER transmit without an antenna
- ⦿ Doing so can damage the radio module
- ⦿ If your board is already connected to the radio module and you need to flash the board, then **connect the antenna**
- ⦿ If you need to update the existing code and your device already run a code that transmit data, **connect the antenna**
- ⦿ **It is safer when programming the device to remove the Arduino board from the female header and program it disconnected from the radio module**
- ⦿ If you deploy a device, make sure that the antenna is correctly connected before powering on the device and realizing any transmission test

Connecting with an FTDI cable

Most Chinese clone version, check the VCC pin

Original Sparkfun
version

For the ProMini, you need to have an FTDI breakout cable working at 3.3v

Check the VCC pin position and make it to correspond to the VCC pin of the FTDI breakout.

Check the Arduino board

- First, just solder the programming header

- To flash the Arduino board with the AgriFutur code
- See slides from "Getting the software: Arduino IDE" to "Uploading to your board"
- If uploading is successful, then you can continue with soldering the remaining header pins, otherwise, take another board as this one may have hardware issue

Select serial port for uploading

After connecting the cable to your computer/laptop USB port, try to find the serial port

If you don't find it, you may need to install specific drivers

<https://learn.sparkfun.com/tutorials/how-to-install-ch340-drivers/all>

Image shown is the Arduino IDE with INTEL-IRRIS code

Uploading to your board

Click on the "upload" button

And wait until upload is completed

Checking that device is operational

```

/dev/cu.usbserial-AK05C87P

Configuration for other type of sensors

- Comment WITH_CAPACITIVE
- Configure the code to build the other types of sensor device
 - 1 tensiometer + 1 soil temp
 - 2 tensiometer + 1 soil temp
 - 1 ambient temp/hum + 1 soil temp
 - 1 CO2 + 1 soil temp
 - 2 soil temp & 3 soil temp

```

////////////////////////////////////
// SENSOR CONFIGURATION PART
////////////////////////////////////

////////////////////////////////////
// uncomment to have a soil humidity capacitive sensor (SEN0308 or other type of capacitive)
// #define WITH_CAPACITIVE
// uncomment to use SEN0308 capacitive calibration for low voltage
// #define SEN0308_CALIBRATION_LOW_VOLTAGE
// uncomment to send millivolt with SEN0308 capacitive
// #define SEN0308_TRANSMIT_MILLIVOLT
////////////////////////////////////
// uncomment to have a soil tensiometer watermark sensor
// #define WITH_WATERMARK
// only for watermark sensors, not relevant for capacitive sensors
// if a soil temperature sensor is wired, the real soil temperature can be used
// #define WM_REF_TEMPERATURE 28.0
// uncomment to force the watermark to have default device address for WaziGate
// #define WM_AS_PRIMARY_SENSOR
// uncomment to have 2 tensiometer watermark sensor on the same device
// #define TWO_WATERMARK
////////////////////////////////////
// uncomment to have 1 soil temperature sensor ST using a one-wire DS18B20 sensor
// also needed for TWO_SOIL_TEMP_SENSOR and THREE_SOIL_TEMP_SENSOR
// #define SOIL_TEMP_SENSOR
// only for watermark sensors, not relevant for capacitive sensors
// #define LINK_SOIL_TEMP_TO_CENTIBAR
////////////////////////////////////
// uncomment to have an additional decagon EC-5 sensor, ONLY ON IRD_PCB
// #define SOIL_EC5_SENSOR
// uncomment to have a CO2 sensor, ONLY ON IRD_PCB
// #define CO2_SCD30_SENSOR
////////////////////////////////////
// uncomment to have an ambient air temp/hum sensor, then select which sensor model below
// #define AIR_TEMP_HUM_SENSOR
////////////////////////////////////
// uncomment to have an ambient air temperature DHT22/AM2305 sensor, ONLY ON IRD_PCB
// #define DHT22_AM2305_TEMP_SENSOR
// uncomment to have an ambient air humidity DHT22/AM2305 sensor, ONLY ON IRD_PCB
// #define DHT22_AM2305_HUM_SENSOR
////////////////////////////////////
// uncomment to have an ambient air temperature SHT sensor, ONLY ON IRD_PCB
// #define SHT_TEMP_SENSOR
// uncomment to have an ambient air humidity SHT sensor, ONLY ON IRD_PCB
// #define SHT_HUM_SENSOR
////////////////////////////////////
// uncomment to have a customized 2 soil temperature device, ONLY ON IRD_PCB
// #define TWO_SOIL_TEMP_SENSOR
// uncomment to have a customized 3 soil temperature device, ONLY ON IRD_PCB
// #define THREE_SOIL_TEMP_SENSOR
    
```

Configuration for Watermark tensiometer

- Default resistor value is 10kOhms
- Change in `watermark.h` file
the `WM_RESISTOR` value to match
the one you are using if needed
- The fully assembled version has a 10kOhms resistor

```
#define WM_RESISTOR 10000
//we defined WM_MAX_RESISTOR=32760 because the transmitted value would be 32760/10=3276
//and currently a bug in WaziGate XLPP decoding code will limit the maximum value to 3276
#define WM_MAX_RESISTOR 32760
```

- Uncomment in main program `WITH_WATERMARK`

```
// uncomment to have a soil tensiometer watermark sensor
#define WITH_WATERMARK
// only for watermark sensors, not relevant for capacitive sensors
// if a soil temperature sensor is wired, the real soil temperature can be used
#define WM_REF_TEMPERATURE 28.0
```

Transmission with the WM sensor

- ⦿ Devices with a WM sensor will have a different default address
 - ⦿ 26011D**B1** instead of 26011D**AA** for capacitive
- ⦿ 2 values are transmitted
 - ⦿ Centibars converted from resistance value
 - ⦿ Raw resistance value measured for WM sensor, but scaled down by a factor of 10
→ 300 = 3000 Ohms

Static soil temperature with WM sensor

- Without a real temperature sensor, the INTEL-IRRIS code uses a default soil temperature set to 28°C to convert the resistance value into centibars (see <https://www.irrometer.com/200ss.html>)

```
// uncomment to have a soil tensiometer watermark sensor
#define WITH_WATERMARK
// only for watermark sensors, not relevant for capacitive sensors
// if a soil temperature sensor is wired, the real soil temperature can be used
#define WM_REF_TEMPERATURE 28.0
```

- You can change this setting in the code for testing purposes
- It is better to use a real temperature sensor to dynamically get the soil temperature

Real soil temperature with WM sensor

- ⦿ A DS18B20 temperature sensor can be connected to the device

- ⦿ Uncomment in main program SOIL_TEMP_SENSOR

```

////////////////////////////////////
// uncomment to have 1 soil temperature sensor ST using a one-wire DS18B20 sensor
// also needed for TWO_SOIL_TEMP_SENSOR and THREE_SOIL_TEMP_SENSOR
#define SOIL_TEMP_SENSOR
// only for watermark sensors, not relevant for capacitive sensors
#define LINK_SOIL_TEMP_TO_CENTIBAR
    
```

- ⦿ Then, link the measured soil temperature to the centibar calculation performed by the device itself

The Capacitive and Tensiometer sensors

SEN0308 capacitive sensor
Default address is 26011DAA

Watermark WM200
Water tension sensor
Default address is 26011DB1

Configuration for 2 Watermark

- Uncomment in main program TWO_WATERMARK

```
// uncomment to have a soil tensiometer watermark sensor
#define WITH_WATERMARK
// only for watermark sensors, not relevant for capacitive sensors
// if a soil temperature sensor is wired, the real soil temperature can be used
#define WM_REF_TEMPERATURE 28.0
// uncomment to force the watermark to have default device address for WaziGate
// #define WM_AS_PRIMARY_SENSOR
// uncomment to have 2 tensiometer watermark sensor on the same device
#define TWO_WATERMARK
```

- You can still have a soil temperature sensor

```
//////////////////////////////////////
// uncomment to have 1 soil temperature sensor ST using a one-wire DS18B20 sensor
// also needed for TWO_SOIL_TEMP_SENSOR and THREE_SOIL_TEMP_SENSOR
#define SOIL_TEMP_SENSOR
// only for watermark sensors, not relevant for capacitive sensors
#define LINK_SOIL_TEMP_TO_CENTIBAR
```

Configuration for ambient air temp/hum

- Uncomment in main program AIR_TEMP_HUM_SENSOR
- ...and select model: DHT22 or SHT2x
- Dev addr is 26011D**C1** in ABP mode

```

////////////////////////////////////
// uncomment to have an ambient air temp/hum sensor, then select which sensor model below
#define AIR_TEMP_HUM_SENSOR
////////////////////////////////////
// uncomment to have an ambient air temperature DHT22/AM2305 sensor, ONLY ON IRD_PCB
// #define DHT22_AM2305_TEMP_SENSOR
// uncomment to have an ambient air humidity DHT22/AM2305 sensor, ONLY ON IRD_PCB
// #define DHT22_AM2305_HUM_SENSOR
////////////////////////////////////
// uncomment to have an ambient air temperature SHT sensor, ONLY ON IRD_PCB
#define SHT_TEMP_SENSOR
// uncomment to have an ambient air humidity SHT sensor, ONLY ON IRD_PCB
#define SHT_HUM_SENSOR

```

- You can still have a soil temperature sensor

```

////////////////////////////////////
// uncomment to have 1 soil temperature sensor ST using a one-wire DS18B20 sensor
// also needed for TWO_SOIL_TEMP_SENSOR and THREE_SOIL_TEMP_SENSOR
#define SOIL_TEMP_SENSOR
// only for watermark sensors, not relevant for capacitive sensors
#define LINK_SOIL_TEMP_TO_CENTIBAR

```

Configuration for SCD30/40 CO2 sensor

- Uncomment in main program

CO2_SCD30_SENSOR

or

CO2_SCD40_SENSOR

```

////////////////////////////////////
// uncomment to have an SCD30 CO2 sensor, ONLY ON IRD_PCB
#define CO2_SCD30_SENSOR
// uncomment to have an SCD40 CO2 sensor, ONLY ON IRD_PCB
//#define CO2_SCD40_SENSOR
    
```

- Dev addr is 26011DE1 in ABP mode
- You can still have a soil temperature sensor

```

////////////////////////////////////
// uncomment to have 1 soil temperature sensor ST using a one-wire DS18B20 sensor
// also needed for TWO_SOIL_TEMP_SENSOR and THREE_SOIL_TEMP_SENSOR
#define SOIL_TEMP_SENSOR
// only for watermark sensors, not relevant for capacitive sensors
#define LINK_SOIL_TEMP_TO_CENTIBAR
    
```

Configuration for 2 & 3 soil temp

- Uncomment in main program either

TWO_SOIL_TEMP_SENSOR

or

THREE_SOIL_TEMP_SENSOR

```

////////////////////////////////////
// uncomment to have a customized 2 soil temperature device, ONLY ON IRD_PCB
#define TWO_SOIL_TEMP_SENSOR
// uncomment to have a customized 3 soil temperature device, ONLY ON IRD_PCB
// #define THREE_SOIL_TEMP_SENSOR
    
```

- Dev addr is 26011DD1 in ABP mode
- You MUST also have the primary soil temperature sensor

```

////////////////////////////////////
// uncomment to have 1 soil temperature sensor ST using a one-wire DS18B20 sensor
// also needed for TWO_SOIL_TEMP_SENSOR and THREE_SOIL_TEMP_SENSOR
#define SOIL_TEMP_SENSOR
// only for watermark sensors, not relevant for capacitive sensors
#define LINK_SOIL_TEMP_TO_CENTIBAR
    
```

Low battery voltage indication

- ⦿ The sensor device code has low battery voltage indication feature, by default, low battery voltage threshold is set to 2.85V

```
#ifndef WITH_WATERMARK
// the ATmega328P reboots at about 2.65 - 2.75
#define VCC_LOW 2.85
#else
// capacitive sensors can be impacted by low voltage, especially for very dry soil conditions
#define VCC_LOW 2.85
#endif
```

- ⦿ The battery voltage will be transmitted to the gateway as well and will appear on the gateway's dashboard to warn end-user
- ⦿ When low battery voltage is detected, the measure & transmission time interval will increase from 1h to 4h to preserve battery

LORACAM-AI

Advanced Sensing Systems

Many applications need visual information → Image Sensing IoT

2012

2016

2024

ESP32S3 32-bit, dual-core, up to 240 MHz

Image Sensor? Quite a challenge!

Agriculture **Wildlife**
Biodiversity **Agroecology**
Environment

Surveillance

- Low Power
- Plug-and-Sense, out-of-the-box
- Embedded AI processing
- Versatile AI learning framework
- Application-specific AI models
- Robust image encoding against losses
- Long-range radio transmissions
- Efficient usage of radio resources

Proof-of-concept: LORACAM-AI

UPDATED VERSION IN 2025 FOR THE PEPR AGRIFUTUR PROJECT
